CLIPS, QUOTES, and COMMENTS is issued on the first of each month, by the Borderland Sciences Research Associates -- 3524 Adams Ave., San Diego 16, California. Sample copy on request. Most back issues available. Twelve issues (12 months) - $5.00; Six issues (6 months) - $2.50; two issues for $1.00.

Meade Layne, M.A., Editor and BSR Director.

ORTHODOX SCIENCE VERSUS THE UNKNOWN --

(From article by T.M. Comella in SAUCER NEWS -- April-May, 1957.)

"The foregoing categories illustrate the specific reasons why organized flying saucer research has become a chaotic venture. These are man-made problems resulting from personality clashes and a desire to be recognized and the like. But a "natural problem"already existed, that of reconciling unsolved problems with orthodox science. The flying saucers are an unknown and radically different quantity. Yet, there is overwhelming evidence that these elusive objects do exist. The problem now is to resolve an unknown quantity with known knowledge. This is very difficult, as you might guess, and the conclusions one reaches using this type of method can easily be erroneous.

"For example, prior to the Wright Brothers' famous flight, it was considered impossible that Man would ever fly. You may remember the epic statement by one of the top transportation officials of that time. He said, when he viewed the Wright Brothers' machine for the first time: "It will never leave the ground." But it did leave the ground, and that event launched a billion dollar aircraft industry. At that time science denied that Man could ever fly. Yet someone contested science, and Man did fly. We call this progress. But progress is only accomplished when men with open minds approach a subject objectively. Today, saucers are shunned by orthodox science for two basic reasons: First, they exhibit speeds and maneuvers which our physics laws forbid; and secondly, many people claim that these saucers are from outer space, whereas our astronomical concepts disagree. Here is the identical battle the Wright Brothers fought, staring at us face to face.

"In trying to solve this problem, I think we should remember several things: Science, for sure, is not a Sacred Cow. We should not bow down to its accomplishments in such a way that we hinder progress. For science has much to learn, too. Less than 150 years ago the following statements were facts: (1) By spectroscopic analysis the Martian atmosphere was found to be almost 100% oxygen. (2) Also by spectroscopic analysis, astronomers 150 years ago believed that the planet Jupiter was a glowing, hot ball just recently thrown into space by our mother sun. Today scientists can find hardly any oxygen in the atmosphere of Mars, and Jupiter is "known" to be an iceberg. The astronomer Simon Newcomb provided a timely statement in an attempt to explain the varied results astronomers were getting with the spectroscope. He said: "It seems that the results one gets with this instrument depend on what one thinks should be there." In other words, if you don't think there should be oxygen in Mars' atmosphere, chances are you won't find any. The spectroscope is that "touchy"!

"I think we should take a tip from Simon Newcomb and tread lightly on science's playground. We can use the theorems and logic of science when the subject is something we are familiar with. But when we are dealing with unknowns we should be careful. We must have open and objective minds. And we must be liberal with new and fantastic claims and theories, for the saucers themselves are fantastic. What is even more important is that they are a mystery to us - they are unknowns. So we need to discover something new that will enable us to resolve these unknowns. What we know now obviously will not help us. For even with our complicated instruments and formulas, the saucers defy all explanations.

"This will be a new role for science; it will have to be second-best for a while. But merely because science has failed to explain saucers within its framework of reality, there is no reason to deny that those saucers exist. The evidence for them is too overwhelming. Obviously then, the explanation of the flying saucers

lies outside of science's present realm. Now, either science must expand its realm or else Lady Truth will pass us by again. . ."

NOTE: Editor Moseley takes care to clear himself of over-much agreement with Mr. Comella - who, in fact, seems to be quite receptive to basic ideas of the BSR approach.

CONCERNING CHANGES IN THE GENES:

In our Personal Bulletin No. 8, of April 25, '57, we quoted the Probert Control Yada di Shi'ite as saying that unless the bomb tests were discontinued we would in another year reach a "point of no return" with regard to the fall-out. His personal opinion was, that this result could not now be avoided. He could see no hope of any international agreement being reached within the period mentioned. On the evening of April 23 he returned to the subject briefly and we quote his remarks below:

" Concerning changes in the genes. In time and perhaps before very long, the bodily appearance of human beings will be very different. And (as things now stand) I do not mean that coming generations will be more handsome and more intellectual. Quite the contrary - they will be more moronic. Believe me, I say such things with complete detachment. I believe that within 20 years these changes will be apparent. There will be so many of these changes, so many changed people that they will be taken as a matter of course; there will be monstrosities and mental defectives everywhere. This means the loss, the end of your accumulated knowledge, science and culture. These changes will extend not only in mankind but throughout all cellular life, unless the testings are stopped. Your happily awaited New Age will be one of morons and idiots. There will be a marked increase in the incidence of cancer, including leukemia. . . . The irradiation of foods for the purpose of preserving them is bad and dangerous . . . There is no way of escape from the effects of the fall-out, for the rotation of the globe itself spreads these dangerous particles everywhere. . . As to the great windstorms you are having, they are closely connected with the enormous sun spots . . . "

As most of our readers know, the Personal Bulletins mentioned above are sent without charge, but only on receipt of stamped and self-addressed envelopes (preferably # 10 size) It is best to send at least a half-dozen of these 'eps', with the understanding that the bulletins may appear only at long intervals, or when for any reason the mails are not functioning or our regular publications are interfered with or delayed. The demand for this service is now considerable, and takes many hours of office work; and while we do NOT intend to abandon free distribution, occasional small donations will help to keep it going.

- -

The address of biologist John C. Brown (the "B-Cell") is: Care of WB & W Laboratories, P.O. Box 158, Lemoore, Calif. He writes that he is setting up a base of operations in Lemoore, is extremely busy, and cannot distribute more of the B-Cell catalysts for some six months to come. We shall be glad to have reports from anyone using the activated water for plants or otherwise - but please note Mr. Brown's change of address - we have many inquiries.

It was necessary to increase the price of the mimeo book Coming of the Guardians, from $3.50 to $4.00 per copy. We have about 200 copies on hand but cannot supply book dealers and prefer to sell only one to each order.

ml

"GERMANY'S TOP NUCLEAR PHYSICISTS PLEDGE THEY WILL NEVER WORK ON PRODUCTION OF ATOMIC WEAPONS. (From the S.S.R.S. NEWSLETTER,(No. 60 - April, 1957 issue) -- Gambier, Ohio.)---

"Eighteen of Germany's most famous scientists announced April 12 that they would refuse to cooperate in any way in the production, testing or use of atomic weapons. The physicists said they were not politicians but their scientific work placed upon them the responsibility for the possible consequences of their labor. A tremendous effect was created in Germany by the release of the statement because of the prominence of the signers. Nobel Prizewinners Otto Hahn, Werner Heisenberg, Max von Laue and Max Born headed the list. Born is an SSRS member. Another SSRS member Nobelwinner Wolfgang Pauli, was also apparently a signer.

"Other signers included Carl Friedrich von Weizaecker, Walter Gerlach, Fritz Strassman and Friedrich-Adolph Paneth. Chancellor Konrad Adenauer's government made strenuous efforts to counteract the effect of the statement. The physicists' statement was issued through the Max Planck Institute of Physics in Goettingen, one of the principal nuclear research centers in West Germany. Here Heisenberg and von Weizaecker are directing a long-range study of controlled hydrogen fusion.

"The eighteen physicists said that in their opinion a small country such as West Germany could best defend itself and advance the cause of world peace if it expressly and freely went without the possession of any kind of atomic weapons. They said the people of Germany had not been adequately informed of the effects of atomic weapons. They warned that a hydrogen bomb could make a region as large as t h e Ruhr uninhabitable for some time, while the entire populace of 50,000,000 could be injured by the radioactivity. The scientists said that no technical means are known now to defend great concentrations of persons against this danger.

"They declared that not one of them would be prepared to participate in any way in the production, testing and use of atomic weapons. On the other hand, they said it was of the utmost importance to develop the peaceful use of atomic energy and they were prepared to cooperate in this task. The immediate political result of this statement in Germany was what the"New York Times" described as a "furor" and "a major uproar".

"Chancellor Konrad Adenauer, his Defense Ministry and the government propaganda services struck out in all directions today in an effort to neutralize the effect of the warning on German public opinion," the "Times" said. "A survey of today's newspapers indicated that even the warmest supporters of the Chancellor were shaken by the statement." Adenauer issued a counter-statement which was quickly circulated by the government's press service. It said the scientists evidently did not know the results of tests made in the United States providing for the protection of civilians. Also, said Adenauer, the decision to renounce such weapons 'has nothing to do with physical science. That is a purely foreign policy matter.'

"International News Service (according to the "Washington Post") reported that a powerful pacifist group in West Germany was prevailing on leading German scientists to keep all of their know-how --- even that dealing with peaceful uses of atomic energy -- from scientists in other Western countries on grounds that such data would inevitably be funneled to NATO for possible military exploitation. Adenauer's political opponents made the most of their opportunity, describing him as 'totally lacking in respect for the independent opinions of Germany's great men of science.' Then, on April 14, five of the scientists restated their position. As the "New York Times" describes it: "They rejected Dr. Adenauer's assertion that atomic armament was a

political matter for which he, as head of the government, was primarily responsible. They contended that they had a duty as citizens to take a stand and warn the people against the dangers of atomic weapons.

"Professor von Weizsaecker, who appears to be the spokesman for the eighteen,.... said he considered it highly problematic that peace and freedom could be defended by the new instruments of destruction. 'We are aware of the difficulties in making decisions in these matters,' he said. 'We do not believe we can escape t h e responsibility that our profession places upon us in relation to political questions.'

"Professor Hahn explained that the question of atomic armament was a matter of conscience with him. He said that the atomic bomb dropped on Hiroshima in 1945 had made a frightful impression on him and that, as one of the pioneers in atomic research, he felt a certain responsibility for what had happened.

"Professor Gerlach rejected Dr. Adenauer's charge that the scientists were playing politics in the coming general election campaign. 'The bitter experience of our lives has taught us what evil can arise from the misuse of scientific knowl - edge,' he told "Die Welt".

"Professor Mattauch and Walcher... added that they could not be responsible for training in their institutions persons who would only be employed later in t h e construction of atomic bombs."

"SCIENCE COULD UNITE"- by Edward Lyndoe. (From PREDICTION magazine, May 1957 issue--No. 5, Vol. 23.,Pub. at Link House, Store St., Lon., Eng.,-W.C. 1-) --- ". . . . This Geophysical Year is in itself a curiosity. It will consist of no fewer than eighteen months, beginning on July first of this year, and ending on December thirty-first, 1958.

"The whole enterprise involved in what is known as I.G.Y. (International Geo - physical Year) brings rather more than fifty nations together in one tremendous task --undoubtedly the greatest piece of scientific investigation ever undertaken -- at a minimum expenditure of one hundred million pounds.

It is intended to unravel the physical forces under which the Earth moves and, by advantaging the nations of new knowledge, to increase the possibilities for t h e peoples of the world. This is an ambitious programme, and its scope is greater than can be explained in this article. Those interested will need to consult the mounting literature on the subject. Briefly, subjects that will be studied include meteorology, the magnetic field that affects compass navigation, the composition of the atmosphere, the ionosphere, solar activity, cosmic rays, gravity, and a great many related subjects.

"If anyone imagines this to be remote from his private life, he is mistaken. Few questions Man can ask have more importance or urgency than those that are being tackled in this effort, The romantic tinge of it all is best shown by Professor Sydney Chapman's description of Antarctica as 'a part of the Earth of which, in some ways, we know less than we do of the Moon.' To me, as perhaps also to you, this will come as a humiliating corrective. We have grown used to discussing the conquest of space; but it is here brought home to us that mankind has plenty enough to do to make acquaintance with its own small planet. Indeed, one could go so far as to say that very little more can be done to advance most of the largest issues in human life until the secrets of this new continent have been unlocked. Hence the importance of what otherwise might have seemed not much more than a gay bit of ad - venture undertaken for the fun of beating dangers. This is an enterprise of im - mense seriousness, & upon it will probably depend the kind of lives our children & grandchildren may be able to live. . . ."

"ETHER AND THE LIVING UNIVERSE", by W.G. Hooper, Ph.D. (Fellow of the Royal Astronomical Society, 1905-1922). (190 pgs.-) The C.W. Daniel Co., London W.C. 1, Eng. 1935). (Now OP-)

Reading this book is like an adventure in Spiritual Consciousness and a page out of the wisdom of the Mark Probert Controls, for within its enlightened pages t h e author establishes the hypothesis that ether is gravitational and that each planet carries with it its own ether. He points out that there is no distinction between ether or matter since ether includes all the properties of matter. This, o f course, means that the Universe is one thing, or perhaps we should have said, one no-thing.

He reaches the conclusion that ether is not a mere mechanical dead thing, but a living vital force expanding and contracting like a human breathing, and he even finds a relationship between the circulation of the blood and the vibrations o f the ether. The Universe is indeed, alive.

The author is described as being a world traveller and mystic, and the book as the result of thirty years' study and meditation. It is divided into three main parts or "Degrees of the Universe: The Body; The Soul, and the Creative Spirit." Now for a few excerpts: 'If we write about the ether of space and try to understand something of its wonderful properties and qualities, as the basis of a new science and new philosophy of life which is to be the new revelation of the new age, then we are, I submit, dealing with the most profound and interesting topic t h a t confronts the race today.' (23)

'The new theory of ether gives us concentric shells of matter in space; why not watch an onion grow, and notice the concentric shells of life-substance being formed, and then try to find the same principles in ourselves, in the earth, and i n space. That is one key to the only true philosophy that can stand its test in the days to come. For Truth alone will stand, and not mere hypotheses or mental jugglery.' (43)

'If ether is gravitative then every atom and particle in the Universe, as well as every planet, and sun and star, exerts an attractive power over the ether, so that every atom is enveloped in an atmosphere of ether, in the same way that every planet and sun and star is enveloped by the ethereal atmosphere. If the atoms possess different masses or weights, as they do, then each atom would possess an ethereal atmosphere proportionate to its mass, with the result that an atom of carbon, with its atomic weight of 12, ought to possess a denser ethereal atmosphere than an atom of hydrogen, and so on right through the atomic scale.' (51)

'Within the universal space are myriad forms of living beings, of worlds, suns and stars, all moving, never still.' (101)

'On the new theory of time and space, therefore, wherever there is ether, there is also life, and wherever there is life, there is also mind and consciousness.' (123).

I cannot resist taking this gem from his book. Right after the author was nominated and elected as a Fellow of the Royal Astronomical Society, the then President of the R.A.S. invited him to a cup of tea to discuss how he had attained his knowledge.

The first question was, "At what University did you graduate?" The author replied "I have never graduated from any University. I was a teacher, and am now a business man." "Do you mean to tell me," he inquired, "that you have never had any University training?" To which I replied, "The only classes I have attended a t any University were evening classes at the Nottingham University. I worked out this

(contd-) whole theory while doing my ordinary business." His comment was, "Impossible! No one without Univeraity training could have written such a book."

"But there is a training of the mind and soul that can transcend all other training," I replied. He looked at me and smiled, arose, and wished me 'Good-Day!' I often wondered what he thought of me. Yet there was the book. No one could deny that!'

"Perhaps the author himself, being philosophical, penetrated to the very heart of the matter when he stated, 'The only query that matters is, What is Truth? -- Nothing else is of any importance. Names do not matter. But Truth does matter; for Truth lives on when names are forgotten. Truth is eternal.'

"Come to think of it, he could be so right! - Recommended to all Associates." (Reviewed by Associate F.B. Woodruff.)

(Paragraph from letter from R.A. Wheatley, 9341 E. Russell St., Whittier, Calif., to C.Q.C. Editor: ". . . The writer h a s been interested in the so-called witching or properly known as dowsing, since 1920. I do not possess the 'power' or ability to use the dowsing stick, but my wife does. However, along about 1923 I learned how to determine the humans and animals who possess the power. This determination can be made at long distances just as easily as though the person were a few feet distant. Recently I have checked a number of persons to determine if they have R-H factor blood, and so far the checks h a v e been accurate. . ." (The BSR Director will be very glad to have any further information on this.) (ML)

We recommend the following:
"SPACEMEN, FRIENDS OR FOES", by Trevor James.-Brochure (in two parts); total price, $2.00. An important publication. Order from B.S.R.A. Hdqrs. --"Spiritism & The Beginning Of Christianity", by J.R. Morrell. -Pocket-size brochure, $1.00. -- "Speculative Suggestions", compiled by F. Bartholomew. (Brochure in 3 parts, whole price, $1.00.) -- "Apollonius of Tyana", by Alice Winston (an Akashic reading)- $2.00. -- "Greatest Puzzle Of All", by C. Dye.-(an excellent first book in spiritism)- 70 pgs.- $1.00.

VALENCE ANGLES OF NITROGEN AND OXYGEN

by C.F. Krafft

The angle between adjacent valence bonds is 108° for the nitrogen atom and 105° for the oxygen atom. The celebrated nuclear theory of atomic structure, in spite of all its "successes", cannot explain these angles. It has no explanation whatever to offer for the oxygen valence angle, and in regard to the nitrogen angle, it is in a still worse position. It will be remembered that the nuclear theory uses one version in physics, and a very different version in chemistry -- a sort of two-faced proposition. According to the physics version, the nitrogen valence angle should be 90°, while according to the chemistry version, it should be 120°. Neither of them is anywhere near the actual observed value of 108°.

Now let us see what sort of an explanation the much maligned and universally ridiculed ether-vortex theory can offer. The nitrogen vortex atom has three hydrogen groups (valence bonds) and one helium group in its outer shell. If these groups were all of the same size, then the valence angle would be the tetrahedral angle of 109.5°, just as in the carbon atom. Actually, however, the helium group is a little more bulky than the hydrogen group (because it contains more subatomic particles) which will cause the hydrogen groups to be crowded a little closer together, and this is evidently the reason why the nitrogen valence angle is only 108°.

If this reasoning is correct, then it should also be applicable to the oxygen atom, and so it is. The oxygen vortex atom has two helium groups and two hydrogen groups in its outer shell. The valence bonds of the oxygen atom should therefore be crowded together even more than those of the nitrogen atom, and that is evidently the reason why the oxygen valence angle is only 105°.

- - - - - - - - - - - - - - - - - - - -

(Note: I am informed that several of the 'regular' scientific magazines have refused to print the foregoing article, partly on the ground that the vortex theory has not yet reached the 'quantitative stage'. But valence angles are quantitative measurements and have conclusively disproved the nuclear theory.

On account of its importance, the three paragraphs above will be reprinted in our Round Robin XIII - 1, June 15, 1957. M.L.

"REPORT FROM GIANT ROCK CONVENTION --

"To Meade Layne and BSR Associates: You may receive reports of the fourth Flying Saucer Convention at Giant Rock a few miles out in the desert from this point, but on the chance that you would be interested in my version, I will present a short resume as I saw it, May 11 and 12. The attendance on Saturday the 11th was estimated by two of us at roughly 1,500, and on Sunday about the same, or possibly less. And this is regardless of what you may hear. These figures are variable due to continuing arrival and departure of visitors.

"The program featured some previous speakers who repeated their experiences with additions. Dan Fry was the most outstanding of these with discussion of power techniques that were illustrative and informative. Conspicuously absent were George Adamski, George Williamson, the purveyors of tape recordings purporting to be the voices of space people and a few lesser lights who have managed to get into the act on previous meets. Of chief interest were three new speakers. Most outstanding of these were the twin lads (counted as one) from Corpus Christi, Texas, Ray and Rex Stanford, age 18. Their story dating first from 1952 and continuing, was told by Ray in the most refreshing, humorous narrative style that I have yet heard. Their original contact with a space ship occurred on Padre Island on the Gulf Coast, and has been published in various saucer publications. Due to the charmingly human incidents and manner of telling, this report was highly convincing.

"Another was Buck Nelson, a backwoods farmer of Mountain View, Mo. A typical hill country man, elderly, thin, friendly, in blue overalls, Buck says he was approached by spacecraft people for use of his open space, which they used. He took pictures of craft, displayed them at the village drug store, then the Security Forces descended upon him, borrowed the film and actually returned it later. They hired him to move a pole on his lot to another position, presumably that it might have enabled someone to make estimates of size of craft by scale. Then Buck was taken, so he says, on a flight to the Moon, Jupiter and Venus. His observations are not too clear and the point remains -- if this was astral or physical travel. He insists it was physical but I have an impression that he wouldn't know the difference. A point in his favor - the space people required him to empty his pockets to insure against magnetic materials. Also, later the U.S. Security authorities purchased his pants hitch for examination.

"Buck says he had worn glasses all his life, has no need of them now, has been disabled with lumbago and neuritis, is free of all that, apparently a reward for his cooperation with the space people, but he says, 'They never tell you anything, just do it.' An outcome of vast harassment on the part of the U.S. Security has been to take from him his total disability compensation leaving him without support, because of his refusal to deny the whole story. He is told he would get it back if he will go inside the State mental hospital for an examination. He is NOT about to go inside that door. He adds that privately, a Geiger counter burned out when carried over the landing spot of the space ships.

"A third new speaker was Calvin Rowe, of San Jacinto, California, a machinery maintenance man for equipment of the State Forest Service. Rowe reports entertaining space folk in his home, talking with them, riding on ships in the flesh with his wife on hand to see him embark. Trips were from 3-1/2 to 7-1/2 miles altitude. Says interplanetary ships are from 400 feet in diameter and the smaller of 60 feet are nesters for local travel when not inside the larger. Mixed crews are from many planets. Message to him: 'Man, know thyself.' Was advised to study for his particular need under tutelage of Doreal's White Brotherhood, Sedalia, Colorado. (contd)

-- "Of the making of books there is no end...." Everybody is writing a book or another one. Books and books on sale at tables, more coming. Most of them filled with 'contacts', lofty morality and overall sameness.

"I am reeking with the religionistic trend of all talks, books, tent revival meeting atmosphere, moralizing from personal slant, repent or else. Not that I would in any way negate the warnings about bureaucratic treatment of spacecraft, atomic tinkering, radiation, etc. But to my notion this matter of 'Is they are or is they ain't' has no more religious connotation than can be found in a jet plane. I can find the morals for myself in either one.

"The Convention wound up with this statement from Dr. George Van Tassel, host and master of ceremonies: That he has been aware of preparation for a more advance task, that he has been informed of its nature and is now ready to announce it. Precisely this: He is being prepared by the Space People and advanced by them for the Presidency of the United States in 1960. Knowing, as he said, that a president elected in 1960 would not live to completion of his term, he pledged all of his ability to this task and promised that great and important changes would be made in carrying out his obligations to the public." (Letter from Associate Howard Clark Box 484, Yucca Valley, Calif.)

STONE SHOWER IN AUSTRALIA: (From "Denver Post" Denver, Colo., April 17, 1957) -- "Perth, Australia. Government officials and newspapermen are puzzling the mystery of Cyril Penny, the world's most unlucky aborigine, who brings showers of stone around his head. Penny is on his way back to his tribesman grandfather in the west Australian interior to see if the old man can tell him why he has rocks, not in, but around his head. Meanwhile, back on the ranch - of A.K. Donaldson - 96 miles from here, reporters are among the hundreds of curious people who are inspecting the tent in which two newspapermen sat with Penny while stones dropped, apparently from the closed canvas top.

"There were ten men outside the tent. The ridgepole holes were stuffed. Three Australians and Cyril were within the tent. All 14 persons involved are prepared to swear that stones bounced from nowhere inside the tent. A reporter said that the stones came from different angles, softly. They landed, he said, with a thud, and his search turned up no one who could have thrown them. The perplexed Penny sorrowfully asked Donaldson to send him away, pleading that he was the cause of the trouble. Other aborigines took up a collection to speed his departure.
Penny got another job at a ranch in the next county, and the stones started plopping all around him once more. It became so discouraging he decided to go back to the tribe -- if they'd have him.
"The Sydney weather-bureau said that tornado fall-out, rather than Penny, could be the cause. A tornado, the bureau notes, could pick up objects such as stones and drop them as its strength dissipated. Residents, however, aren't so easily convinced." (Clip sent in by Assoc. F. Schmidt).
